## Review

### Adversarial Games

- \* Start state
- \* Terminal state (End/Goal)
- \*  $\text{Result}(s, a)$  (Transition model)
- \* Player(s)
- \* Utility function

Player 1 seek to maximize the utility  
(Max)  
Player 2 " minimize the utility  
(Min) function

$$\text{Minimax}(s) = \begin{cases} \min_{a: \text{actions}(s)} \text{Minimax}(s') & \text{if player is min} \\ \max_{a: \text{actions}(s)} \text{Minimax}(s') & \text{if player is max} \\ \text{Utility}(s) & \text{if } s \text{ is a terminal state} \end{cases}$$

where  $s' = \text{succ}(s, a)$

$\max$   
 $a \in \text{actions}(s)$   
 $s' = \text{succ}(s, a)$

Utility(s) is implemented.

Assume Result(s,a) is implemented and it returns the successor of s when applying action a

Code this algorithm

```
def action-chosen(state):
```

```
    """
    Return the optimal
    action to take
    """
```

```
def max-value(state):
```

```
    """
    Return the
    max value
    we could get at
    state
    """
```

```
def min-value(state):
```

```
    """
    Return the min
    value we could get
    at state
    """
```

$$3 = \max(3, -2)$$

$$= \max(\boxed{\min(3, 15, 6)}, \boxed{\min(-2, 15, 3)})$$

$$= \max\left(\min\left(\begin{array}{l} \downarrow \text{max}(3, -2) \\ \text{max}(3, -2) \end{array}, \begin{array}{l} \text{max}(15, 1) \\ \text{max}(15, 1) \end{array}, \begin{array}{l} \text{max}(-1, 6) \\ \text{max}(-1, 6) \end{array}\right), \right.$$

$$\left. \min\left(\begin{array}{l} \text{max}(-3, -2) \\ \text{max}(-3, -2) \end{array}, \begin{array}{l} \text{max}(15, 10) \\ \text{max}(15, 10) \end{array}, \begin{array}{l} \text{max}(1, 3) \\ \text{max}(1, 3) \end{array}\right)\right)$$

```
def max-value (state):
```

```
    """  
    Return max value at a state  
    """
```

```
    if terminal-state (state):  
        return Utility (state)
```

```
    else:  
        values-s' = []  
        for a in Actions (state):  
            s' = Result (state, a)  
            values-s'.append (Min-value (s'))  
        return max (values-s')
```

```
def Min-value (state):
```

```
    """  
    Return min value at a state  
    """
```
